PLAY ►  
Animate the predictions

The Climate Prediction Center's seasonal outlook maps show the probability of deviation from normal. For instance, an area covered in dark red has a 50% chance of higher-than-normal temperature in a given three-month period.

# Stakeholder Use of Climate Info & Forecasts

## *Common across all groups: climate vs. weather*

Uninformed, mistaken about forecast interpretation

Understand implications of “normal” vs. “unknown” forecasts

Use of forecasts limited by lack of demonstrated forecast skill

## *Common across many, but not all, stakeholders*

Have difficulty distinguishing between “good” & “bad” products

Have difficulty placing forecasts in historical context

## *Unique among stakeholders*

Relevant forecast variables, regions (location & scale), seasons, lead times, performance characteristics

Technical sophistication: base probabilities, distributions, math

Role of forecasts in decision making

# Goals of Forecast Communication

**Interpretation should be: Correct, Reliable, Easy**

## Elements to Consider

- Variable depicted: temperature, temperature anomaly, probability, probability anomaly
- Two-category or three-category forecast
- Forecast reference period
- Probability ranges: colors, numeric scales
- 'No forecast' situation
- Appropriate spatial scale
- Translation of information
- Extension of information

# Field Survey Methodology

## Surveys at Professional Society Meetings

- Common population
- Independent testing of different forecast formats
- Preclude 'learning' by respondents
- Sufficient sample size (across surveys)

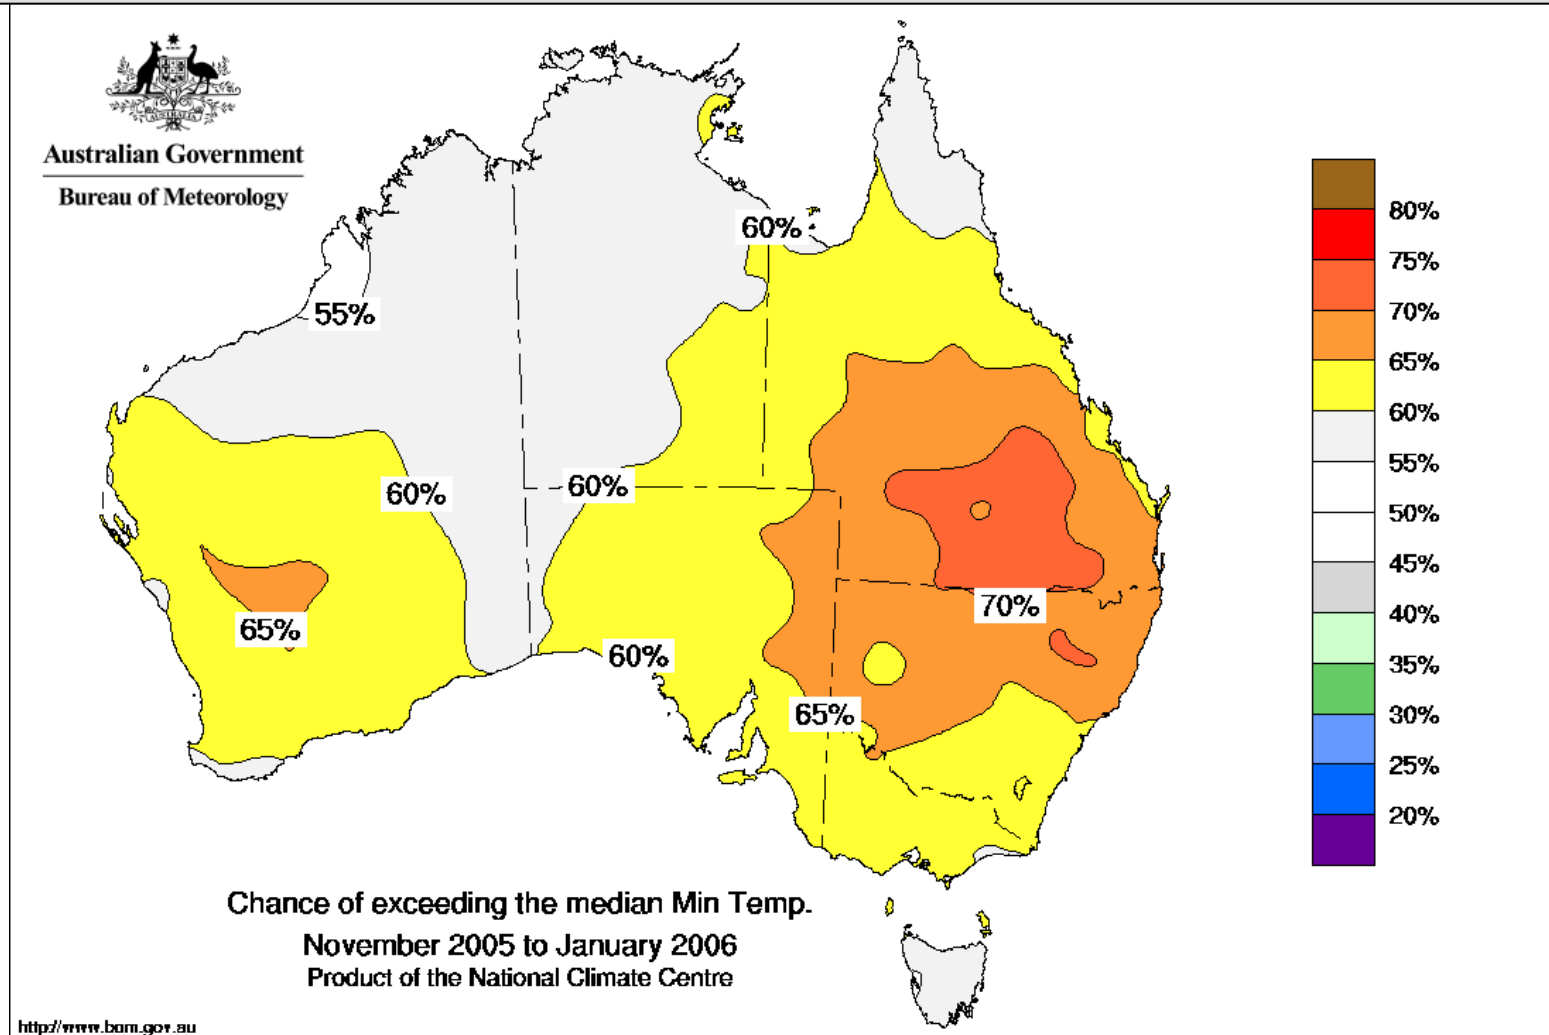

## Experimental Protocol

- Multiple forecast products
- One forecast per survey
- Well mixed distribution of surveys
- Attempt 100% distribution
- Supplement with 1-on-1 interviews

# Canada: Temperature

Three maps = one forecast  
 Terciles  
 1961-1990 reference period  
 Forecast everywhere

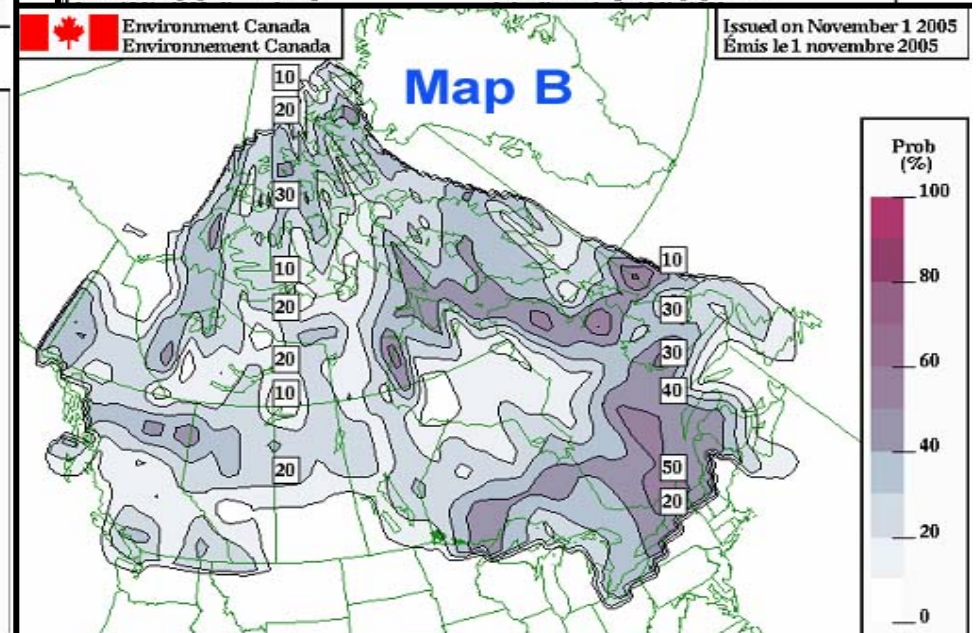

Forecast probability of above normal temperature (no calibration)  
 Period: November-December 2005 - January 2006  
 Based on 3 equiprobable categories

Probabilités prévues que les températures soient au-dessus de la normale (non-calibrées)  
 Période: novembre-décembre 2005 - janvier 2006  
 Basé sur 3 catégories équiprobables

Forecast probability of below normal temperature (no calibration)  
 Period: November-December 2005 - January 2006  
 Based on 3 equiprobable categories from 1961-1990 climatology

Probabilités prévues que les températures soient sous la normale (non-calibrées)  
 Période: novembre-décembre 2005 - janvier 2006  
 Basé sur 3 catégories équiprobables de la climatologie 1961-1990

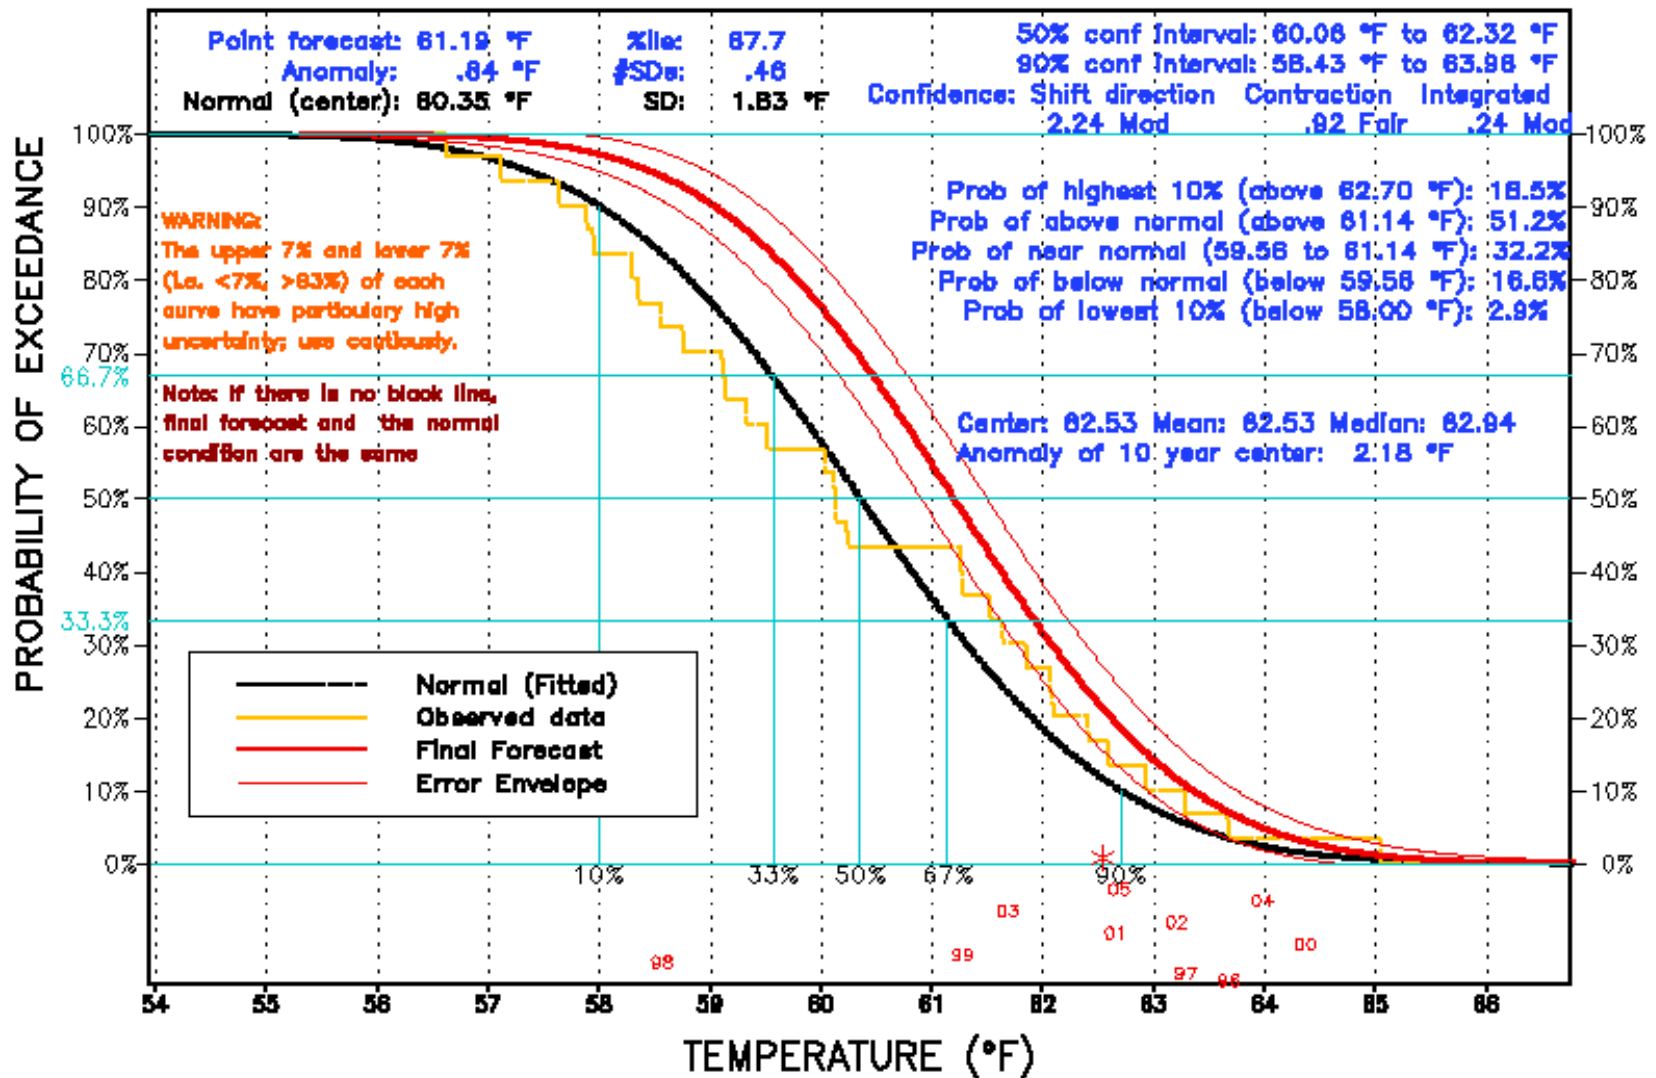

Forecast probability of near normal temperature (no calibration)  
 Period: November-December 2005 - January 2006  
 Based on 3 equiprobable categories from 1961-1990 climatology

Probabilités prévues que les températures soient près de la normale (non-calibrées)  
 Période: novembre-décembre 2005 - janvier 2006  
 Basé sur 3 catégories équiprobables de la climatologie 1961-1990

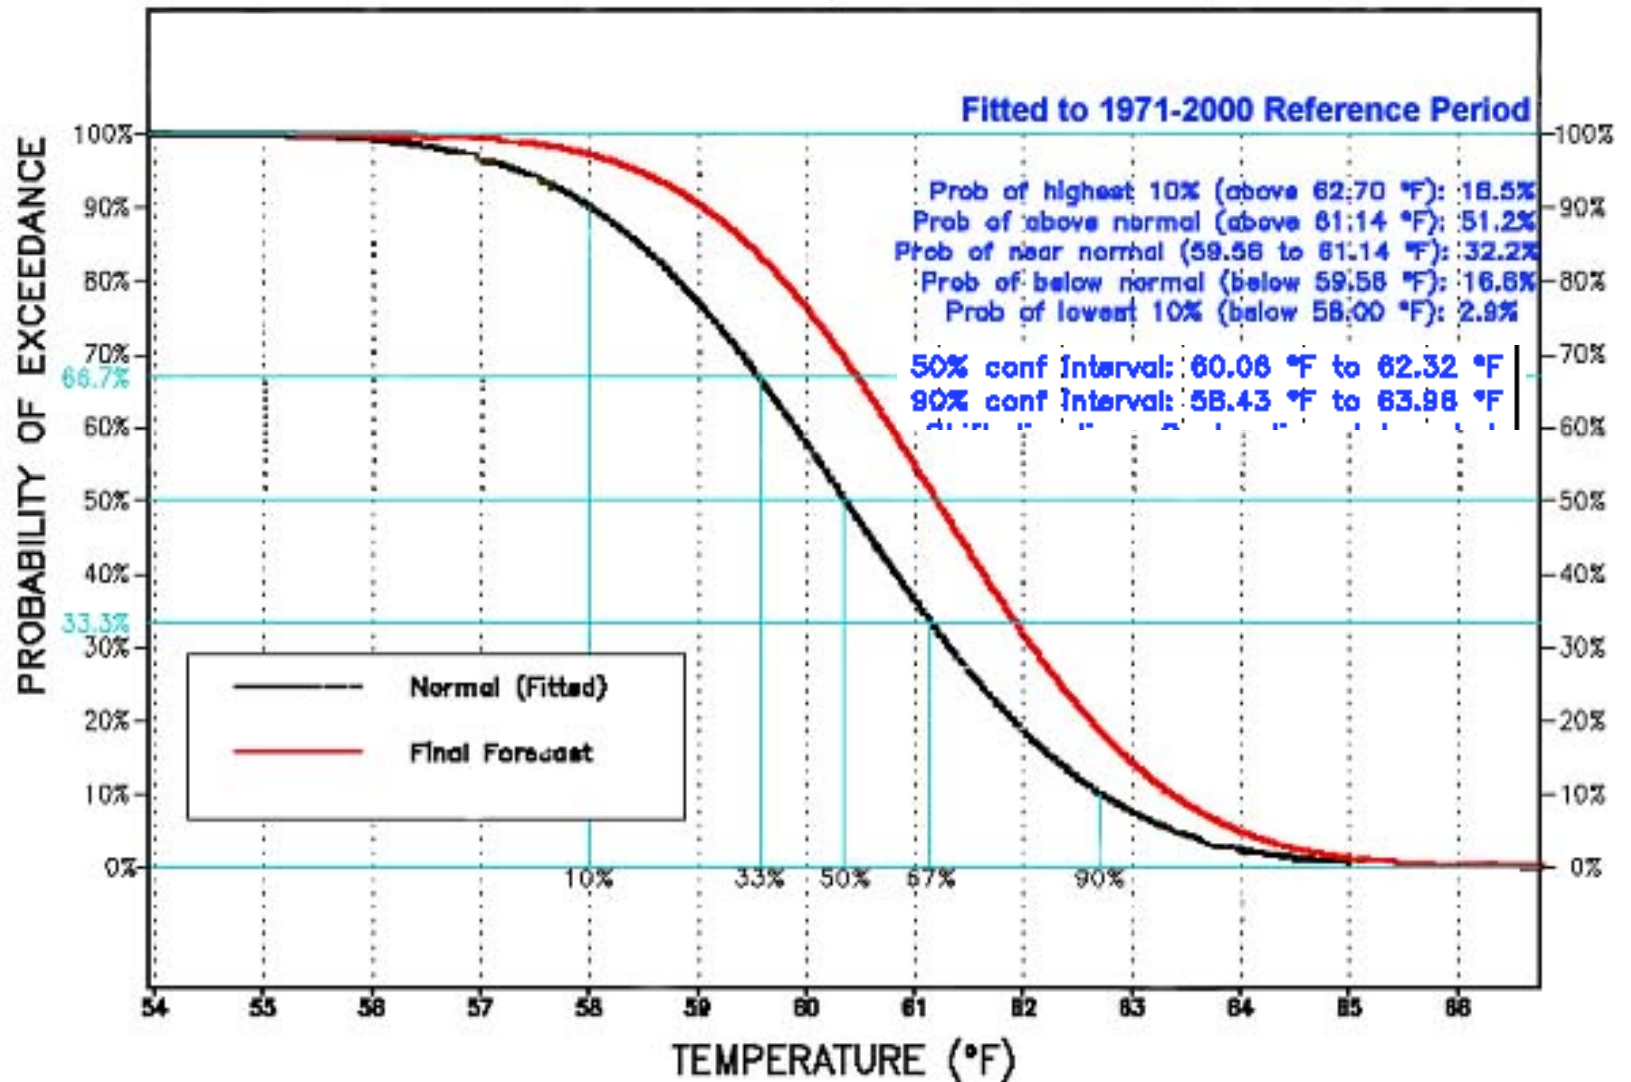

# CPC Probability of Exceedance Outlook

Climate Division 98 (Southeastern Arizona)

# First Survey Effort: AWRA

## **American Water Resources Association Annual Meeting, Seattle, WA, 11/05**

- **Diverse representation within sector**
- **Attendance: about 475 over 4 days**

### **Logistics**

- **Manageable meeting size**
- **Smaller meeting = simplified environment**
- **“Hustle and Harass”**
- **Total response: 136 + interviews**

# Findings: People, Product

**Respondents had high potential for considering climate variability.**

water quality, stormwater management, watershed restoration, water supply planning, floodplain studies, groundwater, saltwater intrusion, watershed management, water economics, utility asset management, permitting and regulatory review, geomorphology, water law and policy, forest hydrology, infrastructure design, planning, operations

# Findings: People, Product

---

**Respondents had high potential for considering climate variability.**

**Forecast users did worse at answering correctly than non-users!**

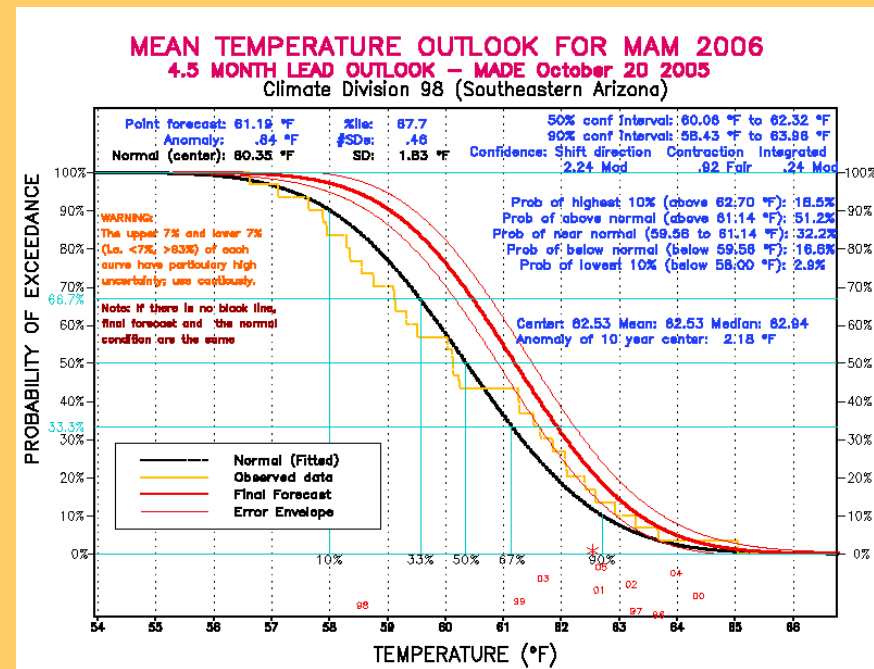

# Findings: People, P

Respondents had high po  
climate variability.

Forecast users did worse  
non-users!

No format was more effective than any other.  
POE is notably ineffective.

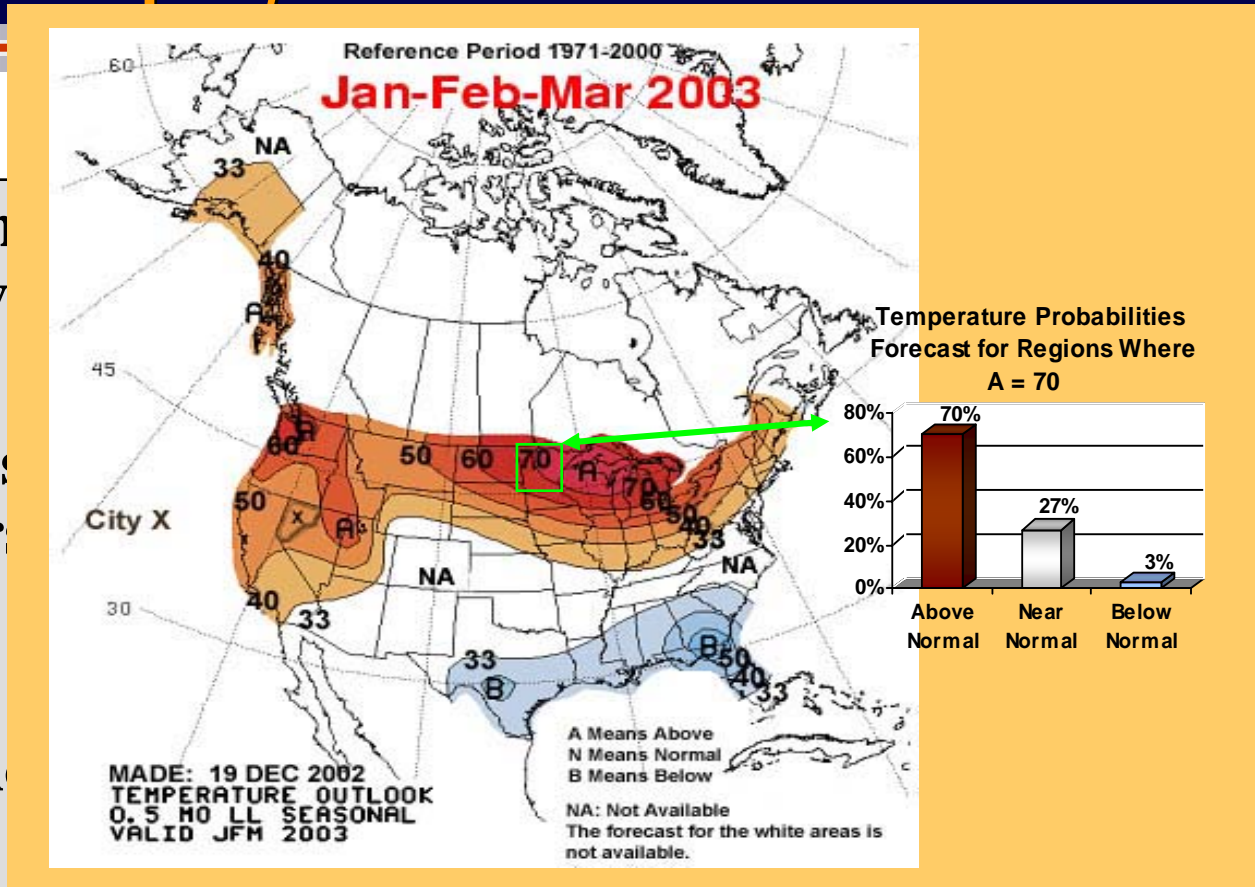

# Findings: People, Product

Respondent  
climate v

Forecast us  
non-user

No format  
POE is n

Our 'fixes' were no better – except simplifying the POE graph. Issue: introducing more complexity, without structure, persistent language problems.

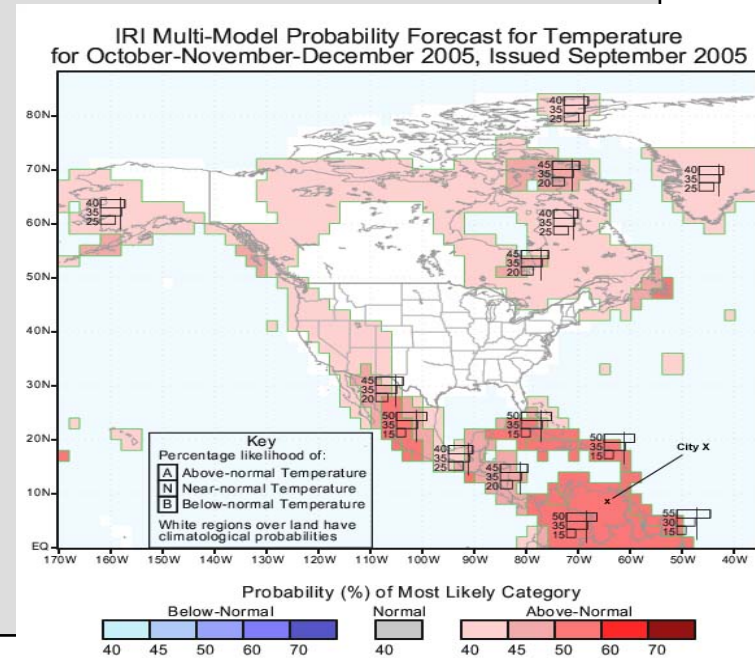

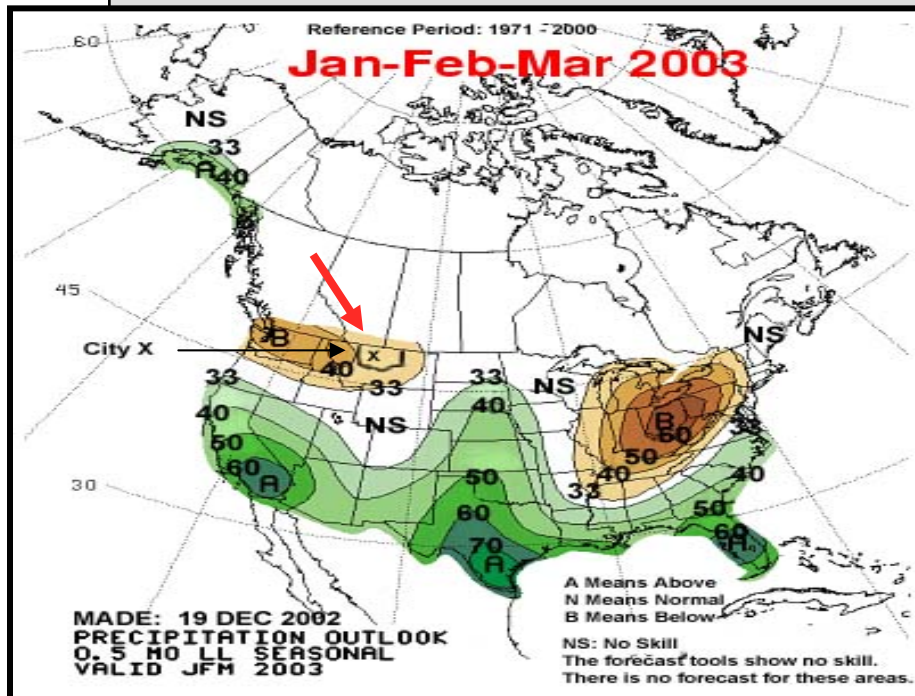

# Findings: Identification, Discernment

**Reference Period: people could *identify* the reference period, mostly... but we didn't test *interpretation*.**

# Findings: Identification, Discernment

Reference Period: people could *identify* the reference period, mostly... but we didn't test *interpretation*.

Spatial scale: local to regional to global. IRI (grid) and CPC with regional outline were best.

# Findings: Identification, Discernment

**Reference Period:** people could *identify* the reference period, mostly... but we didn't test *interpretation*.

**Spatial scale:** local to regional to global. IRI (grid) and CPC with regional outline were best.

**People *can* discern probabilistic nature, with assistance** (% , pie chart, bar chart, big title)

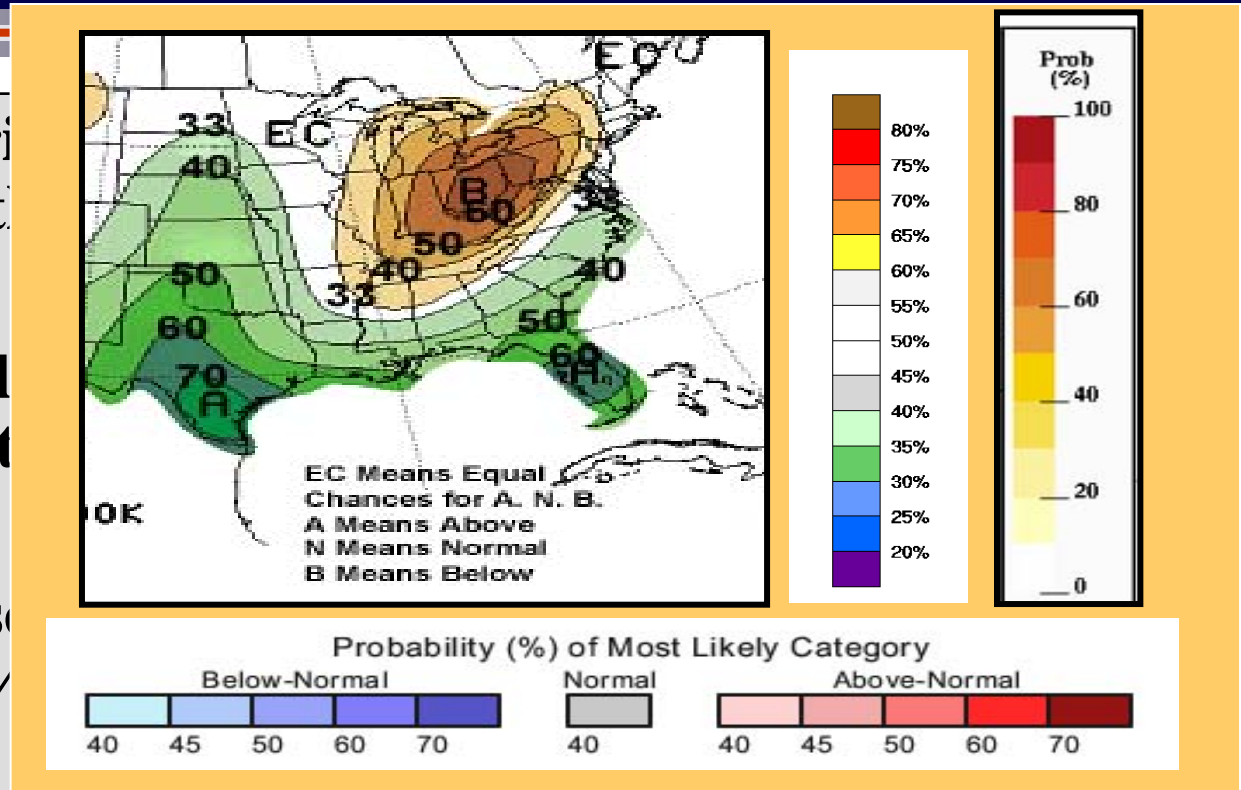

# Findings: Identification, Discernment

Reference Period  
period, most

Spatial scale: 1  
and CPC with

People *can* dis  
assistance (%)

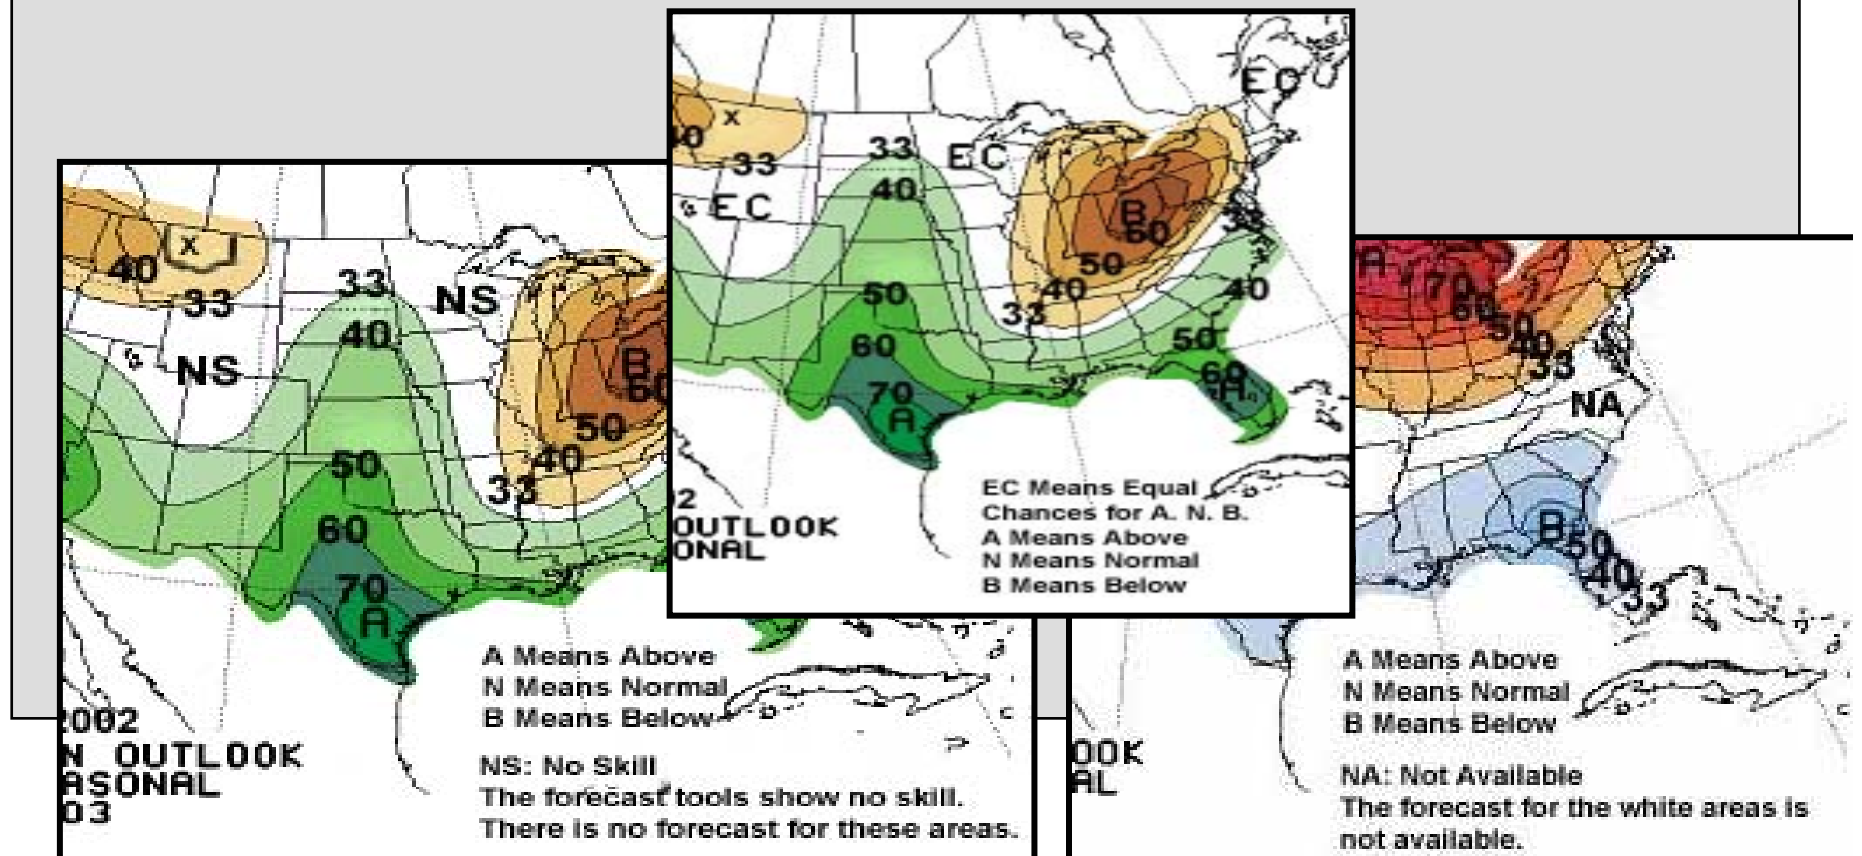

Expressing probability: difficulty putting bounds on probability ranges. Concept of a range of values: people indicated precise probability rather than a range of probabilities.

# Findings: Translation, Extension

## Reluctance to translate information

**‘No Forecast’ language: No Skill seems to work better than Not Available, Equal Chances, or Climatological Probabilities.**

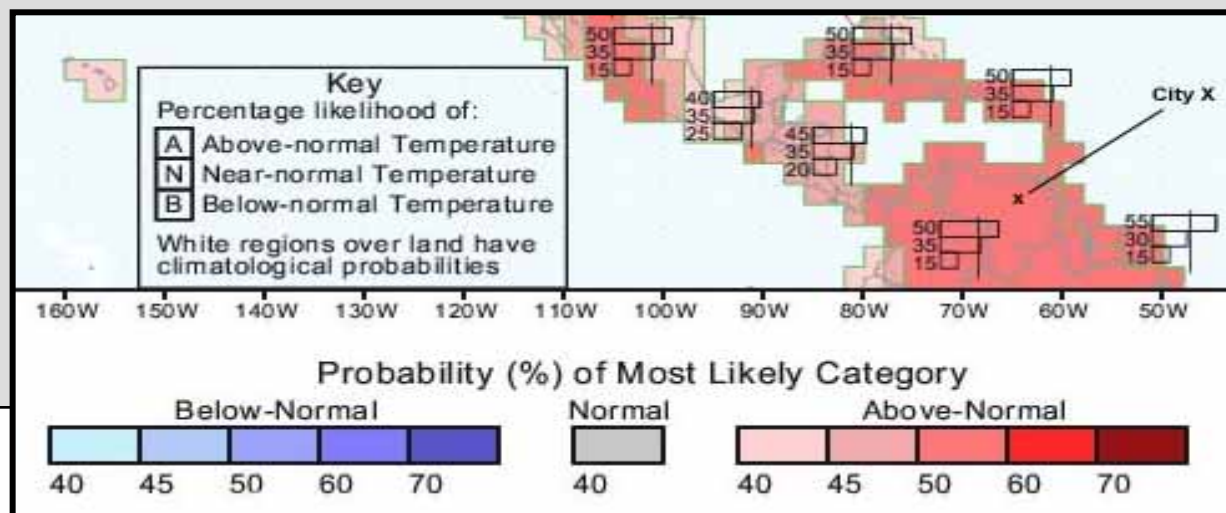

# Findings: Translation, Extension

## Reluctance to translate information

**‘No Forecast’ language: No Skill seems to work better than Not Available, Equal Chances, or Climatological Probabilities.**

**People have difficulty comprehending terciles, even with graphical assistance. Source of confusion = terminology: ‘above’, ‘below’, ‘normal’ and ‘near normal’.**

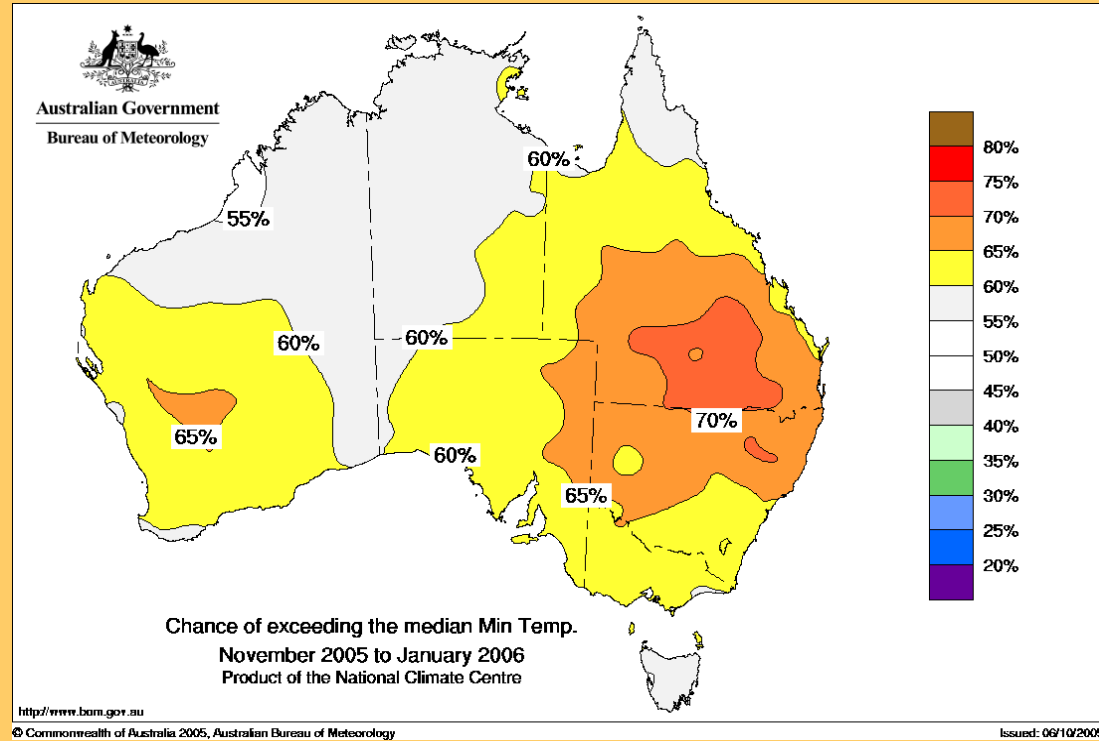

# Findings: Translation, Extension

## Reluctance

'No Forecast' language  
Available, Equal C

People have difficulty  
graphical assistance  
'above', 'below', 'n

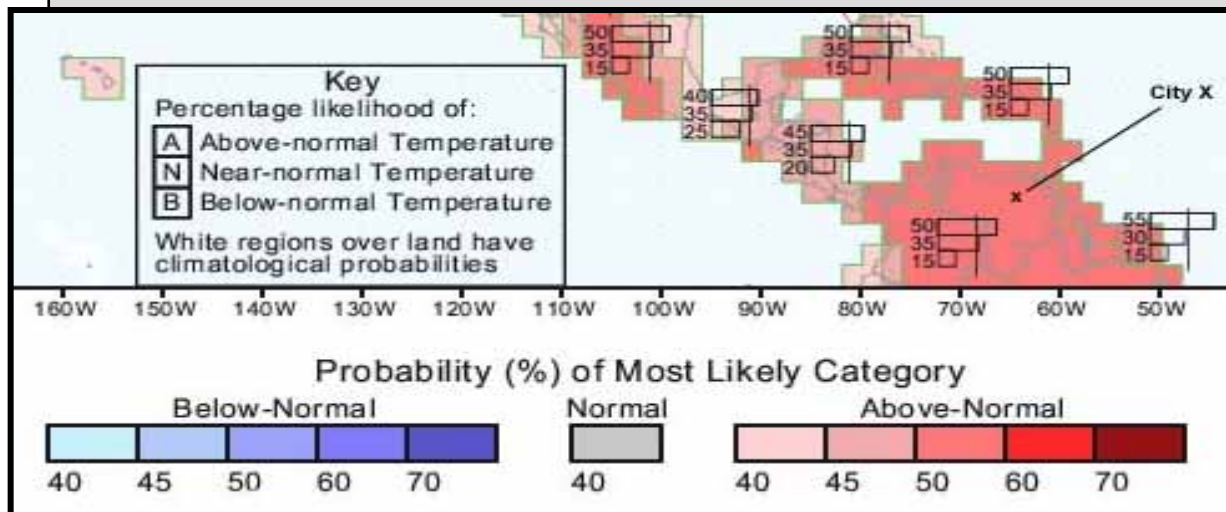

Reluctance to link even median and upper/lower half of  
reference distribution.

# Findings: Translation, Extension

## Reluctance to translate information

**‘No Forecast’ language: No Skill seems to work better than Not Available, Equal Chances, or Climatological Probabilities.**

les, even with  
= terminology:  
nal’.

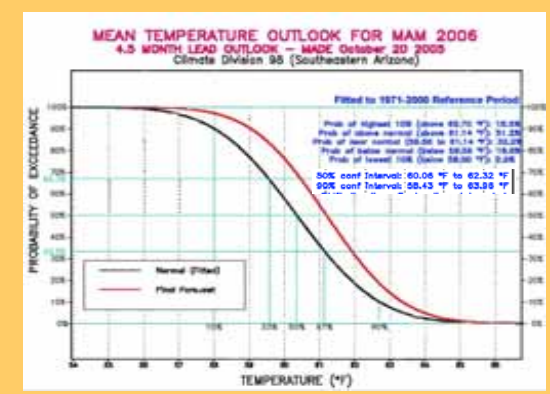

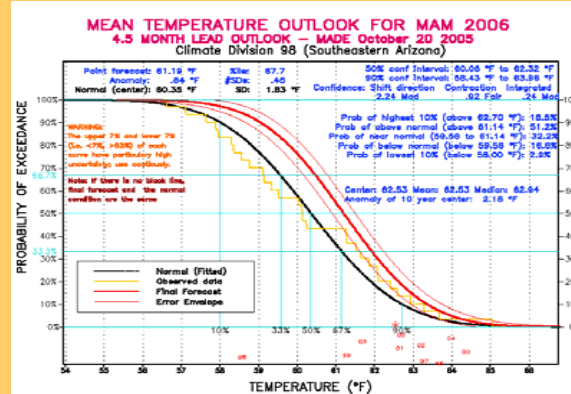

lower half of

**Reluctance to specify probabilities for less likely categories.**

# Probability of Exceedance Outlooks

Unique product...  
unique results

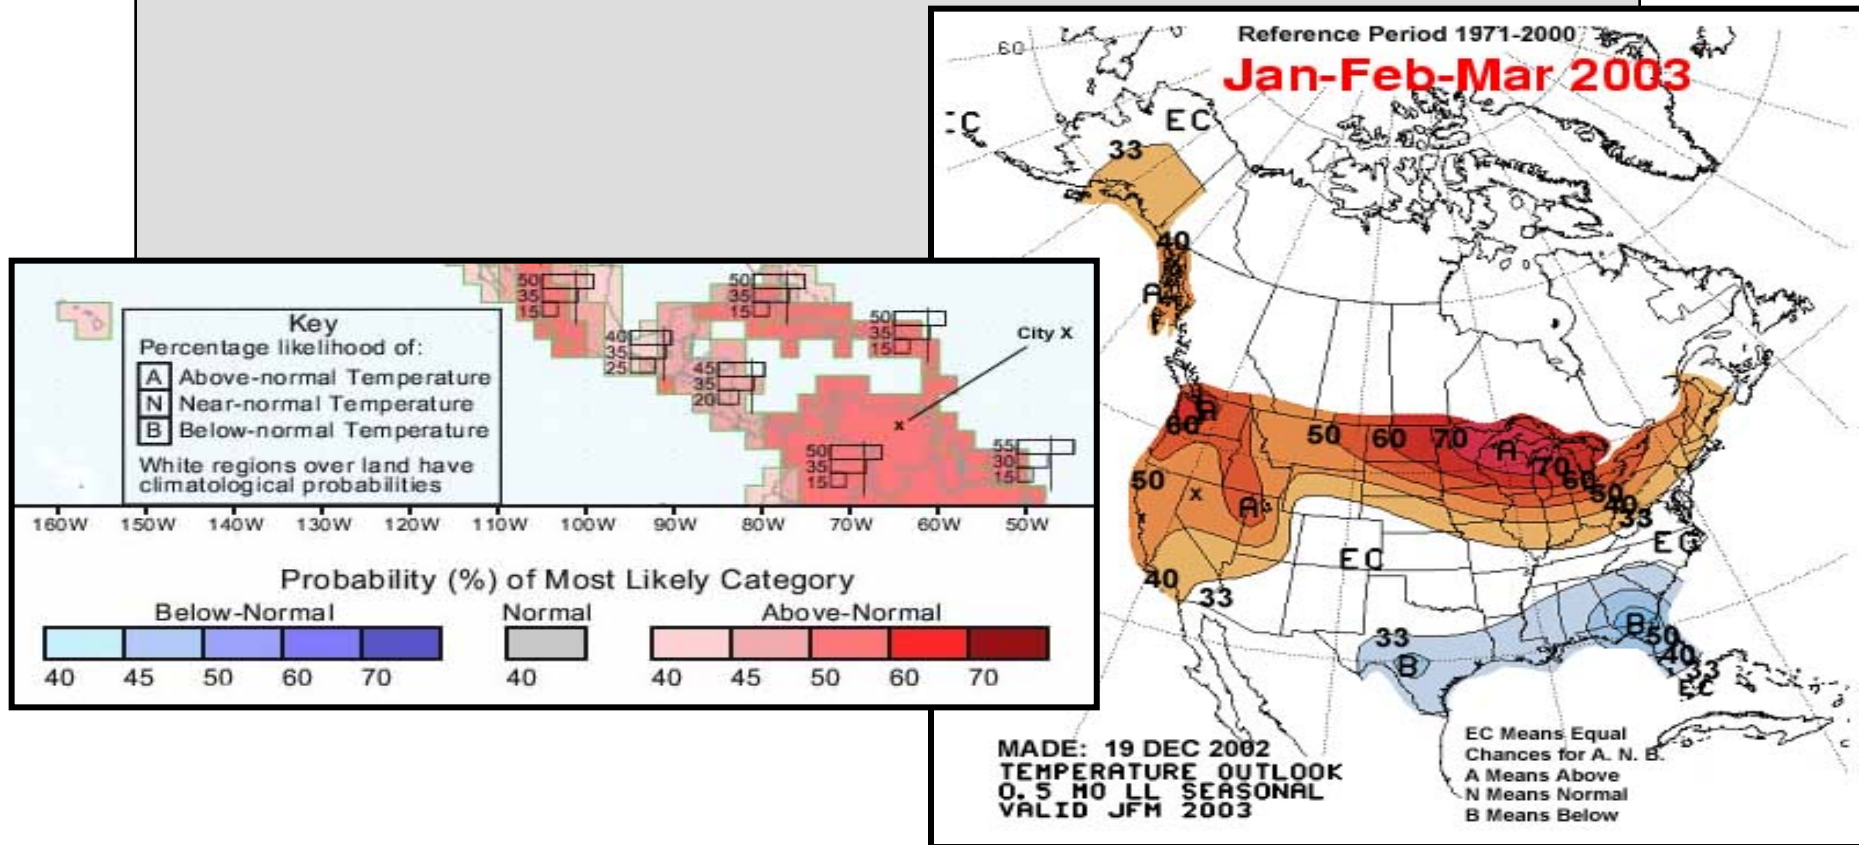

Return rate was extremely low and most questions had no correct answers.

Simplified version had highest response rate and much higher rate of correct answers.

*No one* correctly answered that the probability of a single value is nearly zero...

# Findings/Recommendations

Information itself insufficient. Disconnected elements create confusion. People have trouble coordinating and connecting the dots... ..

# Findings/Recommendations

**Information itself insufficient. Disconnected elements create confusion. People have trouble coordinating and connecting the dots... ..**

**Confusion, tentativeness over basic principles: e.g., probability range=0-100%; median divides upper and lower half of distribution; forecasts address all three terciles.**

# Findings/Recommendations

**Information itself insufficient. Disconnected elements create confusion. People have trouble coordinating and connecting the dots... ..**

**Confusion, tentativeness over basic principles: e.g., probability range=0-100%, median divides upper and lower half of distribution; forecasts address all three terciles.**

**Structure information within product format.**

**Explicit reinforcement of basic principles.**

# Boundary Maintenance

## **Survey quotes:**

**It's obviously intended for use by meteorologists and climatologists who use these every day.**

**Get rid of techie language that only makes sense to other forecasters.**

**Make it more understandable for the layperson.**

**I just couldn't figure out what they basically tried to tell me.**

## **Interview messages:**

**This product must not be applicable to my work, because otherwise I would understand it.**
